

```
"""
```

```
Extract every Trader_IGGID value from redservice.t_raw_detail_audit  
for the date range 20-Apr-2026 to 24-Apr-2026, all 15 systems.
```

```
Hits the 15 monthly system sub-partitions directly  
(t_raw_detail_audit_<s>_202604) instead of the parent, so we don't  
depend on the planner choosing partition pruning correctly. Postgres  
prunes the daily sub-partitions inside each monthly partition.
```

```
Output: trader_iggid_20apr_24apr_2026.xlsx (one column).
```
